AB	<p>Printing of nylon or polyester fabrics, plastic or metal foils, or paper is effected by coating a master sheet (paper) having a surface of cotton or nylon flocks or pile with a pattern using a thermosensitive marking material (sublimable dye), overlapping the master with a thermosensitive copy sheet and exposing the free surface of the master or copy sheet to irradiation whereby the pattern is transferred by volatilization of the marking material. The masters produce up to 150 copies. The pattern may be formed by a template or electrostatically or by xerog. Thus, a stencil is prep'd: and an ink made by adding bonding and thickening agents to a liquid color is applied through it by means of a brush onto a sheet carrying nylon flocks. After drying 10 min at 65°, the master is covered with a nylon woven cloth and the pattern transferred by passage of a flatiron at 205° over it. Greater than 75 copies can be prepared and copies may also be made on polyester or 60% polyester, 40% viscose non-woven material.</p>				
IC	B41M				
CC	74-8 (Radiation Chemistry, Photochemistry, and Photographic Processes)				
ST	Image reprod'n color sublimation				
IT	<p>Copying process Printing (by transfer of thermosensitive sublimable dyes)</p>
